

**ABSTRACT OF THE DISCLOSURE**

An apparatus for and method of parsing the plurality of input parameters  
5 received from a user terminal into an ordered ASCII string of predefined format. This  
permits the user to receive nearly realtime responses to service requests requiring a  
plurality of ordered input parameters. This is accomplished when the Active Server  
Page (ASP) module calls the WebParse.dll module for parsing. Thus, the service  
request is honoring in near realtime.
